

1. Identify the M-th maximum number and Nth minimum number in an array and then find the sum of it and difference of it.

Test cases:

output –

{16, 16, 16 16, 16}, M = 0, N = 1

(illegal input)

{0, 0, 0, 0}, M = 1, N = 2

0

{-12, -78, -35, -42, -85}, M = 3 , N = 3

-7

{15, 19, 34, 56, 12}, M = 6 , N = -3

(illegal input)

{85, 45, 65, 75, 95}, M = 5 , N = 2

-20

Program:

```
#include<stdio.h>
```

```
int main(){
    int size=0;
    printf("Enter the total no. of elements: ");
    scanf("%d",&size);

    int arr[size];
    printf("Enter the elements: ");
    for (int i = 0; i < size; i++)
        scanf("%d",&arr[i]);

    int n,m;
    printf("Enter the m value: ");
    scanf("%d",&m);
    printf("Enter the n value: ");
    scanf("%d",&n);

    if(m<=0 || n<=0)
        printf("illegal input...!");

    else if(m>size || n<0)
        printf("illegal input...!");

    else{
        int temp=0;

        for(int i=0;i<size;i++){
            for(int j=0;j<size;j++){
                temp=arr[i];
                arr[i]=arr[j];
                arr[j]=temp;
            }
        }

        printf("Sum: %d\n",arr[size-m]+arr[n-1]);
        printf("Difference: %d",arr[size-m]-arr[n-1]);
    }
}
```

}

Output:

```
C:\Users\Chint\OneDrive\Desktop\toc\DAA\mth max and nth min.exe
Enter the total no. of elements: 5
Enter the elements: 1
5
2
9
6

20    c++;
21    while(low<=high)
22    {
23        c++;
24        c++;
25        if(a[mid]<k)
26        {

```

```

C:\Users\Chint\OneDrive\Desktop\toc\DAAB\binary in time complexity.exe
Enter number of elements:5
Enter elements:
1
2
3
4
5
Enter Element to search:2
Element is found at index 1
Time Complexity : 22
.....
Process exited after 10.48 seconds with return value 0
Press any key to continue . . .

```

2. Write a program to find the reverse of a given number. Estimate the time complexity for the following inputs

a. 1234 b. 6789456 c. 45a34 d – 5926

Program:

```
#include <stdio.h>
```

```
int main() {
```

```
    int n, reverse = 0, remainder;
```

```

printf("Enter an integer: ");
scanf("%d", &n);

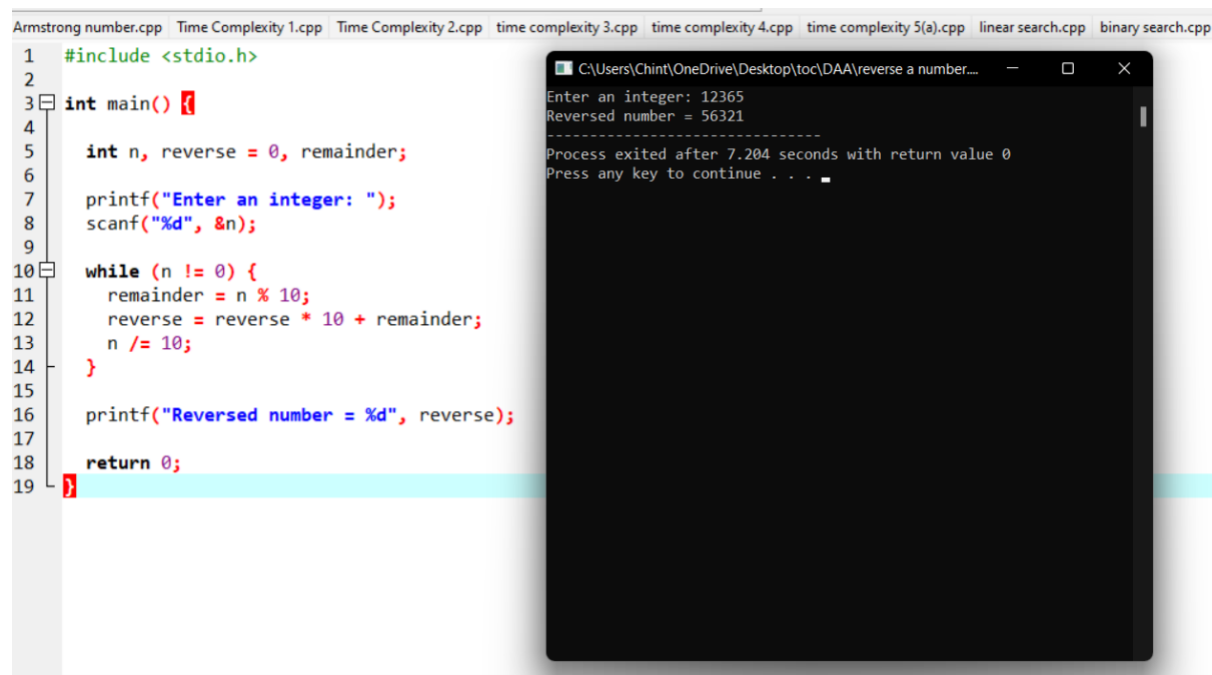

while (n != 0) {
    remainder = n % 10;
    reverse = reverse * 10 + remainder;
    n /= 10;
}

printf("Reversed number = %d", reverse);

return 0;
}

```

Output:

The screenshot shows a C++ IDE with a file explorer at the top listing various files like 'Armstrong number.cpp', 'Time Complexity 1.cpp', etc. The main editor displays the C++ code for reversing a number. To the right, a terminal window shows the program's execution: it prompts for an integer, the user enters 12365, and the program outputs the reversed number 56321. The terminal also shows the process exit message and a prompt to press any key to continue.

```

1  #include <stdio.h>
2
3  int main() {
4
5      int n, reverse = 0, remainder;
6
7      printf("Enter an integer: ");
8      scanf("%d", &n);
9
10     while (n != 0) {
11         remainder = n % 10;
12         reverse = reverse * 10 + remainder;
13         n /= 10;
14     }
15
16     printf("Reversed number = %d", reverse);
17
18     return 0;
19 }

```

```

C:\Users\Chint\OneDrive\Desktop\toc\DAA\reverse a number...
Enter an integer: 12365
Reversed number = 56321
-----
Process exited after 7.204 seconds with return value 0
Press any key to continue . . .

```

3. Write a program to perform sum of subsets problem using backtracking and estimate time complexity. Identify the test cases.

A. Set (s) = (6, 2, 8, 1, 5) sum is 9

B.. Set (s) = (6, -4, 7, -1, 5, 2, 8, 1,) sum is

10

Program:

```

#include <stdio.h>
#define TRUE 1
#define FALSE 0
int inc[50], w[50], sum, n, count=0;
void sumset(int i, int wt, int total);
int promising(int i, int wt, int total) {
    return (((wt+total)>=sum)&&((wt==sum)||((wt+w[i+1])<=sum)));
}
int main() {
    int i, j, n, temp, total=0;

```

```

printf("\n Enter how many numbers:\n");
scanf("%d",&n);
printf("\n Enter %d numbers to th set:\n",n);
for (i=0;i<n;i++) {
    scanf("%d",&w[i]);
    total+=w[i];
}
count++;
printf("\n Input the sum value to create sub set:\n");
scanf("%d",&sum);
for (i=0;i<=n;i++)
    for (j=0;j<n-1;j++)
        if(w[j]>w[j+1]) {
            temp=w[j];
            w[j]=w[j+1];
            w[j+1]=temp;
        }
count++;
printf("\n The given %d numbers in ascending order:\n",n);
for (i=0;i<n;i++)
    printf("%d \t",w[i]);
count++;
if((total<sum))

        for(j = 0; j < 2; j++){
            count++;
            printf("%d\t", c[i][j]);
        }
    }
    count++;
    count++;

    printf(" time complexity is %d",count);

    return 0;
}
}

```

Output:

3. **Write a program to generate all the reverse of a prime should be prime**
(example 907 is prime and reverse 709 is also prime)
Generate all the no's upto N and estimate time complexity.

Program:

```

#include <stdio.h>
int main()
{
    int count=0;
    int n, reverse,sum=0 , flag;
    printf("Enter the prime number:");
    scanf("%d",&n);
    while(n!=0)
    {
        count++;
        reverse = n%10;
    }
}

```

```

        count++;
        sum = sum*10 + reverse;
        count++;
        n= n/10;
        count++;
    }

    printf("\n");
    flag = 0;
    for (int j = 2; j <= sum / 2; j++)
    {
        count++;
        if ((sum % j) == 0)
        {
            count++;
            flag = 1;
            break;
        }
    }
    if (flag == 0)
    {
        count++;
        printf("%d is also prime number",sum);
    }
    else
    {
        count++;
        printf("%d is Not Prime number\n",sum);
    }
    count++;
    printf("time complexity:%d\n",count);
}

```

Output:

```

C:\Users\Chint\OneDrive\Desktop\toc\DAA\prime.exe
Enter the prime number:504
405 is Not Prime number
time complexity:17
-----
Process exited after 4.794 seconds with return value 0
Press any key to continue . . .

```

8. Let there be N workers and N jobs. Any worker can be assigned to perform any job, incurring

some

cost that may vary depending on the work-job assignment. It is required to perform all jobs by assigning exactly one worker to each job and exactly one job to each agent in such a way that the total cost of the assignment is minimized. Write a program to solve a assignment problem for the given data sets using branch and bound.

	Job 1	Job 2	Job 3	Job 4
Person A	12	8	9	10
Person B	11	10	10	9
Person C	9	11	8	12
Person D	11	9	23	7

9. Compute the program to find the GCD of two numbers. And also find the finf of time Recursion

used to estimate time complexity.

Perform the test cases for the given set of no's

A. (36,48) B. (144, 90) C. (-56,88) D. (84,84)

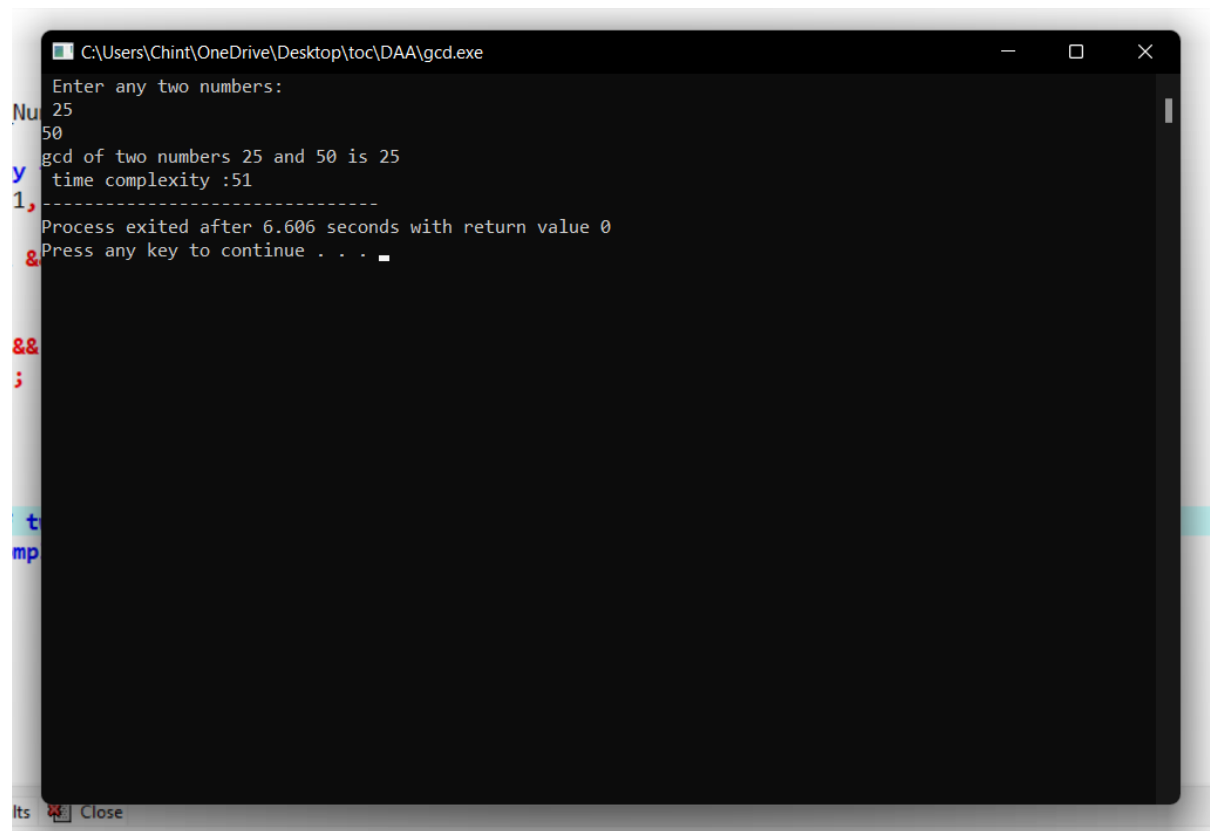

Program:

```
#include <stdio.h>
int main()
{
    int n1, n2, i, GCD_Num;
    int count=0;
    printf ( " Enter any two numbers: \n ");
    scanf ( "%d %d", &n1, &n2);

    for( i = 1; i <= n1 && i <= n2; ++i)
    {
        count++;
        if (n1 % i ==0 && n2 % i == 0)
            GCD_Num = i;
        count++;
    }
    count++;

    printf ("gcd of two numbers %d and %d is %d \n ", n1, n2, GCD_Num);
    printf("time complexity :%d ",count);
    return 0;
}
```

Output:

```
C:\Users\Chint\OneDrive\Desktop\toc\DAA\gcd.exe
Enter any two numbers:
25
50
gcd of two numbers 25 and 50 is 25
time complexity :51
-----
Process exited after 6.606 seconds with return value 0
Press any key to continue . . .
```

10. Using Divide and Conquer strategy to find Max and Min value in the list and estimate time complexity.

Testing Condition – Count the number of times in Comparison to find Min_Max value in a list n for the given set of elements.

A. (23,45,6,8,-9,44,7,8)

B. (8,-5,7,2,6,0,1,9)

C. (45, y, 9, 8,4, 7,11, 22,16)

Program:

```
#include<stdio.h>
#include<stdio.h>
int max, min;
int a[100];
void maxmin(int i, int j)
{
    int max1, min1, mid;
    if(i==j)
    {
        max = min = a[i];
    }
    else
    {
        if(i == j-1)
        {
            if(a[i] < a[j])
            {
                max = a[j];
            }
        }
    }
}
```

```

    min = a[i];
}
else
{
    max = a[i];
    min = a[j];
}
}
else
{
    mid = (i+j)/2;
    maxmin(i, mid);
    max1 = max; min1 = min;
    maxmin(mid+1, j);
    if(max < max1)
        max = max1;
    if(min > min1)
        min = min1;
}
}
}
int main ()
{
    int i, num;
    printf ("\nEnter the total number of numbers : ");
    scanf ("%d",&num);
    printf ("Enter the numbers : \n");
    for (i=1;i<=num;i++)
        scanf ("%d",&a[i]);

    max = a[0];
    min = a[0];
    maxmin(1, num);
    printf ("Minimum element in an array : %d\n", min);
    printf ("Maximum element in an array : %d\n", max);
    return 0;
}

```

Output:

```
C:\Users\Chint\OneDrive\Desktop\toc\DAA\min max.exe

Enter the numbers :
2
1
3
9
Minimum element in an array : 1
Maximum element in an array : 9
-----
Process exited after 17.9 seconds with return value 0
Press any key to continue . . .
```

11. Generate a program for Pascal triangle. Estimate the time complexity for the row=5

```

      1
    1  1
  1  2  1
1  3  3  1
1  4  6  4  1
```

Program:

```
#include<stdio.h>
int main()
{
    int rows, coef = 1, space, i, j;
    int count=0;
    printf("Enter the number of rows: ");
    scanf("%d", &rows);
    for (i = 0; i<rows; i++)
    {
        count++;
        for (space = 1; space <= rows - i; space++)
            printf(" ");
        count++;
        for (j = 0; j <= i; j++)
        {
            count++;
            if(j == 0 || i == 0){
                coef = 1;
                count++;
            }
            printf("%d", coef);
            coef = coef * (i - j) / (j + 1);
        }
        printf("\n");
    }
}
```

```

    else
    {
        coef = coef * (i - j + 1) / j;
    }
    count++;
    printf("%4d", coef);
}
printf("\n");
count++;
}
printf("time complexity:%d",count);
return 0;
}

```

Output:

```

C:\Users\Chint\OneDrive\Desktop\toc\DAA\pascal.exe
Enter the number of rows: 5
      1
     1 1
    1 2 1

  1 4 6 4 1
time complexity:50
-----
Process exited after 3.585 seconds with return value 0
Press any key to continue . . .

```

12. Compute Binomial coefficient for n=8, k=8 using dynamic programming

Using condition such as

I $nCk = 1$ if $k=0$ or $n=k$

II $nCk = (n-1)Ck-1 + (n-1)Ck$ for $n>k>0$

Program:

```

#include <stdio.h>
int count=0;
int bin_table(int val) {
    for (int i = 0; i <= val; i++) {
        count++;
        printf("%2d", i);
        int num = 1;
        for (int j = 0; j <= i; j++) {
            count++;
            if (i != 0 && j != 0)
                num = num * (i - j + 1) / j;

```

```

        count++;
        printf("%4d", num);
    }
    printf("\n");
    count++;
}
}
int main() {
    int value = 5;
    bin_table(value);
    printf("Time complexity:%d",count);
    return 0;
}

```

Output:

```

0 1
1 1 1
2 1 2 1
3 1 3 3 1
4 1 4 6 4 1
5 1 5 10 10 5 1
Time complexity:54
-----

```

13. Write a program to find the largest element value in an array. Estimate the time complexity and no of

comparison for the given set of values.

Program:

```

#include <stdio.h>
int main() {
    int n;
    int count=0;
    double arr[100];
    printf("Enter the number of elements (1 to 100): ");
    scanf("%d", &n);
    count++;
    for (int i = 0; i < n; ++i) {
        count++;
        printf("Enter number%d: ", i + 1);
        scanf("%lf", &arr[i]);
    }
    for (int i = 1; i < n; ++i) {
        count++;
        if (arr[0] < arr[i]) {
            arr[0] = arr[i];
        }
        count++;
    }

    printf("Largest element = %.2lf \n ", arr[0]);
    printf("time complexity:%d\n",count);
}

```

```
return 0;
}
```

Output:

```
Select C:\Users\Chint\OneDrive\Desktop\toc\DAA\largest number.exe
Enter the number of elements (1 to 100): 4
Enter number1: 23
Enter number2: 56
Enter number3: 2
Enter number4: 34
Largest element = 56.00
time complexity:11

-----
Process exited after 10.76 seconds with return value 0
Press any key to continue . . .
```

14. Consider a two integer arrays **nums1** and **nums2**, sorted in non-increasing order and two integers **m** and **n**, representing the number of elements in **nums1** and **nums2** respectively. Write a program to Merge them into a single array using Merge Sort. Derive time complexity of merge sort.

Program:

```
#include <stdio.h>
#include <stdlib.h>

// Merges two subarrays of arr[].
// First subarray is arr[l..m]
// Second subarray is arr[m+1..r]
void merge(int arr[], int l,
           int m, int r)
{
    int i, j, k;
    int n1 = m - l + 1;
    int n2 = r - m;

    // Create temp arrays
    int L[n1], R[n2];

    // Copy data to temp arrays
    // L[] and R[]
    for (i = 0; i < n1; i++)
        L[i] = arr[l + i];
    for (j = 0; j < n2; j++)
        R[j] = arr[m + 1 + j];

    // Merge the temp arrays back
    // into arr[l..r]
```

```

// Initial index of first subarray
i = 0;

// Initial index of second subarray
j = 0;

// Initial index of merged subarray
k = 1;
while (i < n1 && j < n2)
{
    if (L[i] <= R[j])
    {
        arr[k] = L[i];
        i++;
    }
    else
    {
        arr[k] = R[j];
        j++;
    }
    k++;
}

// Copy the remaining elements
// of L[], if there are any
while (i < n1) {
    arr[k] = L[i];
    i++;
    k++;
}

// Copy the remaining elements of
// R[], if there are any
while (j < n2)
{
    arr[k] = R[j];
    j++;
    k++;
}
}

// l is for left index and r is
// right index of the sub-array
// of arr to be sorted
void mergeSort(int arr[],
               int l, int r)
{
    if (l < r)
    {
        // Same as (l+r)/2, but avoids
        // overflow for large l and h
        int m = l + (r - l) / 2;

        // Sort first and second halves
        mergeSort(arr, l, m);
        mergeSort(arr, m + 1, r);

        merge(arr, l, m, r);
    }
}

```

```

}

// UTILITY FUNCTIONS
// Function to print an array
void printArray(int A[], int size)
{
    int i;
    for (i = 0; i < size; i++)
        printf("%d ", A[i]);
    printf("\n");
}

// Driver code
int main()
{
    int arr[] = {12, 11, 13, 5, 6, 7};
    int arr_size = sizeof(arr) / sizeof(arr[0]);

    printf("Given array is \n");
    printArray(arr, arr_size);

    mergeSort(arr, 0, arr_size - 1);

    printf("\nSorted array is \n");
    printArray(arr, arr_size);
    return 0;
}

```

Output:

1. $N = 0.2$

.16. Write a program for to perform liner search and estimate time complexity. Compute the amount of time for completion.

Input series

A = (56,89,7,13,75, 23, 8, 12) Key element 75

B= (89,45 -23,45,0, 44, 2) Key element 0

C= (45,67,56,A,34,-2,100) Key element 90

Program:

```
#include<stdio.h>
int main()
{
    int c=0;
    int n,k,i,j,f=0,a[50];
    c++;
    printf("Enter number of elements:");
    scanf("%d",&n);
    printf("Enter elements:\n");
```

```

for(i=0;i<n;i++)
{
    c++;
    scanf("%d",&a[i]);
}
c++;
printf("Enter Element to search:");
scanf("%d",&k);
for(i=0;i<n;i++)
{
    c++;
    c++;
    if(k==a[i])
    {
        printf("Element is found at index %d\n",i);
        f=1;
        c++;
    }
}
c++;
c++;
if(f==0)
{
    printf("Element is not found");
}
printf("\nTime Complexity : %d",c);
}

```

Output:

The screenshot shows a Windows command prompt window titled "C:\Users\Chint\OneDrive\Desktop\toc\DAA\linear search.exe". The program prompts the user to "Enter number of elements: 5" and "Enter elements:". The user enters the numbers 2, 3, 4, 2, 1. Then, it prompts "Enter Element to search:" and the user enters 1. The program outputs "Element is found at index 4" and "Time Complexity : 20". Below this, it shows "Process exited after 13.46 seconds with return value 0" and "Press any key to continue . . .". On the left side of the image, a portion of the C++ source code is visible, showing the implementation of the linear search algorithm.

17. Write a program to find the factorial (fact) of a number and to estimate time complexity.

Condition such as i. $n=0$, return 1 otherwise $\text{fact}(n-1) * n$

Program:

```

#include <stdio.h>
int main() {

```

```

int n, i;
int count=0;
unsigned long long fact = 1;
printf("Enter an integer: ");
scanf("%d", &n);
count++;
if (n < 0)
    printf("Error! Factorial of a negative number doesn't exist.");
else {
    for (i = 1; i <= n; ++i) {
        fact *= i;
        count++;
    }
    printf("Factorial of %d = %llu \n ", n, fact);
    printf(" time compexity : %d ",count);
}

return 0;
}

```

Output:

```

C:\Users\Chint\OneDrive\Desktop\toc\DAA\factorial.exe
Enter an integer: 5
Factorial of 5 = 120
time compexity : 6
-----
Process exited after 2.145 seconds with return value 0
Press any key to continue . . .

**18. Write a program to perform Knapsack problem for the following set of object values.,
Knapsack weight 100**

item	Weight	Profit
1	40	80
2	30	70
3	20	50
4	30	80

Program:

```
# include<stdio.h>
```

```
void knapsack(int n, float weight[], float profit[], float capacity) {
    float x[20], tp = 0;
    int i, j, u;
    u = capacity;

    for (i = 0; i < n; i++)
        x[i] = 0.0;

    for (i = 0; i < n; i++) {
        if (weight[i] > u)
            break;
        else {
            x[i] = 1.0;
            tp = tp + profit[i];
            u = u - weight[i];
        }
    }

    if (i < n)
        x[i] = u / weight[i];

    tp = tp + (x[i] * profit[i]);

    printf("\nThe result vector is:- ");
    for (i = 0; i < n; i++)
        printf("%f\t", x[i]);

    printf("\nMaximum profit is:- %f", tp);
}
```

```
int main() {
    float weight[20], profit[20], capacity;
    int num, i, j;
    float ratio[20], temp;

    printf("\nEnter the no. of objects:- ");
    scanf("%d", &num);

    printf("\nEnter the wts and profits of each object:- ");
    for (i = 0; i < num; i++) {
        scanf("%f %f", &weight[i], &profit[i]);
    }

    printf("\nEnter the capacity of knapsack:- ");
    scanf("%f", &capacity);

    for (i = 0; i < num; i++) {
        ratio[i] = profit[i] / weight[i];
    }

    for (i = 0; i < num; i++) {
        for (j = i + 1; j < num; j++) {
            if (ratio[i] < ratio[j]) {
                temp = ratio[j];
            }
        }
    }
}
```

```

        ratio[j] = ratio[i];
        ratio[i] = temp;

        temp = weight[j];
        weight[j] = weight[i];
        weight[i] = temp;

        temp = profit[j];
        profit[j] = profit[i];
        profit[i] = temp;
    }
}

knapsack(num, weight, profit, capacity);
return(0);
}

```

Output:

```

C:\Users\Chint\OneDrive\Desktop\toc\DAA\knapsack.exe
Enter the no. of objects:- 4
Enter the wts and profits of each object:- 40 80
30 70

30 80
Enter the capacity of knapsack:- 100
The result vector is:- 1.000000 1.000000 1.000000 0.500000
Maximum profit is:- 240.000000
-----
Process exited after 64.38 seconds with return value 0
Press any key to continue . . .

```

19. Write a program to print the first n perfect numbers. (Hint Perfect number means a positive integer that is equal to the sum of its proper divisors)

Sample Input:

N = 3

Sample Output:

First 3 perfect numbers are: 6 , 28 , 496

Test Cases:

2. N = 0

3. N = 5

4. N = -2

5. N = -5

Program:

```
#include <stdio.h>

int main()
{
    int i, j, end, sum;

    /* Input upper limit to print perfect number */
    printf("Enter upper limit: ");
    scanf("%d", &end);

    printf("All Perfect numbers between 1 to %d:\n", end);

    /* Iterate from 1 to end */
    for(i=1; i<=end; i++)
    {
        sum = 0;

        /* Check whether the current number i is Perfect number or not */
        for(j=1; j<i; j++)
        {
            if(i % j == 0)
            {
                sum += j;
            }
        }

        /* If the current number i is Perfect number */
        if(sum == i)
        {
            printf("%d, ", i);
        }
    }

    return 0;
}
```

Output:

The screenshot shows a code editor with a C program and a terminal window displaying its output. The code editor has tabs for several files: 'Armstrong number.cpp', 'Time Complexity 1.cpp', 'Time Complexity 2.cpp', 'time complexity 3.cpp', 'time complexity 4.cpp', 'time complexity 5(a).cpp', and 'linear search.cpp'. The active file is 'reverse a number.cpp', which contains the C code for finding perfect numbers. The terminal window, titled 'Select C:\Users\Chint\OneDrive\Desktop\toc\DAA\perfect numbers.exe', shows the program's execution. It prompts for an upper limit (100) and displays the output: 'All Perfect numbers between 1 to 100: 6, 28, ...'. The program then exits after 2.658 seconds with a return value of 0.

```
15 printf("All Perfect numbers between 1 to %d:\n", end);
16
17 /* Iterate from 1 to end */
18 for(i=1; i<=end; i++)
19 {
20     sum = 0;
21
22     /* Check whether the current number i is Perfect number or not */
23     for(j=1; j<i; j++)
24     {
25         if(i % j == 0)
26         {
27             sum += j;
28         }
29     }
30
31     /* If the current number i is Perfect number */
32     if(sum == i)
33     {
34         printf("%d, ", i);
35     }
36 }
37
38 return 0;
39 }
```

```
Enter upper limit: 100
All Perfect numbers between 1 to 100:
6, 28,
.....
Process exited after 2.658 seconds with return value 0
Press any key to continue . . .
```

20. Program to Find Even Sum of Fibonacci Series Till number N?(day 2)

Sample Input: n = 4

Sample Output: 33

(N = 4, So here the Fibonacci series will be produced from 0th term till 8th term: 0, 1, 1, 2, 3, 5, 8, 13, 21)

Sum of numbers at even indexes = 0 + 1 + 3 + 8 + 21 = 33)

Program:

```
#include<stdio.h>
int fab(int n){
    int n1=0,n2=1,n3,c=0,sum=0,ini=0;
    int count=0;
    printf("%d %d ",n1,n2);
    while(c<n){
        count++;
        n3=n1+n2;
        count++;
        printf("%d ",n3);
        if(ini%2==0){
            count++;
            sum+=n3;
            count++;
            c++;
            count++;
        }
        ini++;
        count++;
        n1=n2;
        count++;
        n2=n3;
        count++;
    }count++;
    printf("\nsum: %d\n",sum);
    printf("Time complexity: %d",count);
    return 0;
}

int main(){
    int n;
    printf("Enter the n value: ");
    scanf("%d",&n);
    fab(n);
}
```

Output:

Enter the n value: 4

0 1 1 2 3 5 8 13 21

sum: 33

Time complexity: 48

21. Write a program to perform Selection sort and estimate time Complexity

Estimate the time iteration for the following set of numbers.

A. (10,5, 80,-2,5,23, 45) B. (12, 3, 0, 34, -11, 34, 22, 8) C.(3, 35, -56, 66, 77, ,-78, 82)

Program:

```
#include <stdio.h>
void selectionSort(int arr[], int size);
void swap(int *a, int *b);
void selectionSort(int arr[], int size)
{
    int i, j;
    for (i = 0 ; i < size; i++)
    {
        for (j = i ; j < size; j++)
        {
            if (arr[i] > arr[j])
                swap(&arr[i], &arr[j]);
        }
    }
}
void swap(int *a, int *b)
{
    int temp;
    temp = *a;
    *a = *b;
    *b = temp;
}
int main()
{
    int array[10], i, size;
    printf("How many numbers you want to sort: ");
    scanf("%d", &size);
    printf("\nEnter %d numbers\t", size);
    printf("\n");
    for (i = 0; i < size; i++)
        scanf("%d", &array[i]);
    selectionSort(array, size);
    printf("\nSorted array is ");
    for (i = 0; i < size; i++)
        printf(" %d ", array[i]);
    return 0;
}
```

Output:

How many numbers you want to sort: 5

Enter 5 numbers

5
6
1
4
2

Sorted array is 1 2 4 5 6

22. Determine an optimal tour in a weighted, directed graph. The weights are nonnegative numbers. The

inputs are weighted, directed graph, and n, the number of vertices in the graph. The

graph is

represented by a two-dimensional array W , which has both its rows and columns indexed from 1 to n ,

where $W[i][j]$ is the weight on the edge from the i th vertex to the j th vertex. Write a program for

travelling salesman problem using dynamic programming for the below given graph.

Program:

```
#include <iostream>
```

```
using namespace std;
```

```
const int n = 4;
```

```
const int MAX = 1000000;
```

```
int dist[n + 1][n + 1] = {  
    { 0, 0, 0, 0, 0 }, { 0, 0, 10, 15, 20 },  
    { 0, 10, 0, 25, 25 }, { 0, 15, 25, 0, 30 },  
    { 0, 20, 25, 30, 0 },  
};
```

```
int memo[n + 1][1 << (n + 1)];
```

```
int fun(int i, int mask)
```

```
{
```

```
    if (mask == ((1 << i) | 3))  
        return dist[1][i];
```

```
    if (memo[i][mask] != 0)  
        return memo[i][mask];
```

```
    int res = MAX;
```

```
    for (int j = 1; j <= n; j++)

```

23. Write a program using choice to check

Case 1: Given string is palindrome or not

Case 2: Given number is palindrome or not

Sample Input:

Case = 1

String = MADAM

Sample Output:

Palindrome

Test cases:

- 1. MONEY**
- 2. 5678765**
- 3. MALAY12321ALAM**
- 4. MALAYALAM**
- 5. 1234.4321**

24. Write a program to insert a number in a list

Testing Condition

- i. Insert at the beginning**
- ii. Insert in the middle**
- iii. Insert at the last**
- iv. Not Available position in a list**

Program:

```
#include<stdio.h>  
#include<stdlib.h>  
  
#define MAX 100
```

```

int list[MAX];
int position, num, size = 0;

void insertAtBeginning() {
    int i;
    if (size == MAX) {
        printf("List is full. Cannot insert at the beginning\n");
        return;
    }

    for (i = size; i > 0; i--) {
        list[i] = list[i - 1];
    }

    list[0] = num;
    size++;
    printf("Number %d inserted at position %d\n", num, position);
}

void insertInMiddle() {
    int i;
    if (size == MAX) {
        printf("List is full. Cannot insert in the middle\n");
        return;
    }

    for (i = size; i > position - 1; i--) {
        list[i] = list[i - 1];
    }

    list[position - 1] = num;
    size++;
    printf("Number %d inserted at position %d\n", num, position);
}

void insertAtLast() {
    if (size == MAX) {
        printf("List is full. Cannot insert at the end\n");
        return;
    }

    list[size] = num;
    size++;
    printf("Number %d inserted at position %d\n", num, size);
}

int main() {
    int choice;
    while (1) {
        printf("1. Insert at the beginning\n");
        printf("2. Insert in the middle\n");
        printf("3. Insert at the last\n");
        printf("4. Exit\n");
        printf("Enter your choice: ");
        scanf("%d", &choice);

        switch (choice) {
            case 1:

```

```

        printf("Enter the number to insert: ");
        scanf("%d", &num);
        position = 1;
        insertAtBeginning();
        break;

    case 2:
        printf("Enter the number to insert: ");
        scanf("%d", &num);
        printf("Enter the position to insert the number: ");
        scanf("%d", &position);
        if (position < 1 || position > size + 1) {
            printf("Invalid position\n");
        } else {
            insertInMiddle();
        }
        break;

    case 3:
        printf("Enter the number to insert: ");
        scanf("%d", &num);
        position = size + 1;
        insertAtLast();
        break;

    case 4:
        exit(0);

    default:
        printf("Invalid choice\n");
        break;
    }
}

return 0;
}

```

Output:

Insert at the beginning

2. Insert in the middle

3. Insert at the last

4. Exit

Enter your choice: 1

Enter the number to insert: 5

Number 5 inserted at position 1

1. Insert at the beginning

2. Insert in the middle

3. Insert at the last

4. Exit

Enter your choice: 2

Enter the number to insert: 6

Enter the position to insert the number: 2

Number 6 inserted at position 2

1. Insert at the beginning

2. Insert in the middle

3. Insert at the last

4. Exit

Enter your choice: 3

Enter the number to insert: 4
 Number 4 inserted at position 3
 1. Insert at the beginning
 2. Insert in the middle
 3. Insert at the last
 4. Exit
 Enter your choice: 4

25. The n-queens puzzle is the problem of placing n queens on an n x n chessboard such that no two queens attack each other. Given an integer n, return all distinct solutions to the n-queens puzzle. You may return the answer in any order. Write a program for the same.

Program:

```
#include<stdio.h>
#include<conio.h>
#include<math.h>
int a[30],count=0;
int place(int pos) {
    int i;
    for (i=1;i<pos;i++) {
        if((a[i]==a[pos])||((abs(a[i]-a[pos])==abs(i-pos))))
            return 0;
    }
    return 1;
}
void print_sol(int n) {
    int i,j;
    count++;
    printf("\n\ntime complexity  %#d:\n",count);
    for (i=1;i<=n;i++) {
        for (j=1;j<=n;j++) {
            if(a[i]==j)
                printf("Q\t"); else
                printf("*\t");
        }
        printf("\n");
    }
}
void queen(int n) {
    int k=1;
    a[k]=0;
    while(k!=0) {
        a[k]=a[k]+1;
        while((a[k]<=n)&&!place(k))
            a[k]++;
        if(a[k]<=n) {
            if(k==n)
```

```

        print_sol(n); else {
            k++;
            a[k]=0;
        }
    } else
        k--;
}
}
main() {
    int i,n;
    printf("Enter the number of Queens\n");
    scanf("%d",&n);
    queen(n);
    printf("\nTotal solutions=%d",count);
    getch();
}

```

Output:

```

C:\Users\Chint\OneDrive\Desktop\toc\DAA\n queens.exe
Enter the number of Queens
4

26. Write a program to perform Minimum spanning tree using greedy techniques and estimate time complexity for the given set of values.

Program:

```

#include <limits.h>
#include <stdbool.h>

```

```

#include <stdio.h>
#define V 5
int minKey(int key[], bool mstSet[])
{
    int min = INT_MAX, min_index, count=0;

    for (int v = 0; v < V; v++)
        if (mstSet[v] == false && key[v] < min)
            min = key[v], min_index = v;
        count++;

    return min_index;
}
int printMST(int parent[], int graph[V][V])
{
    int count=0;
    printf("Edge \tWeight\n");
    for (int i = 1; i < V; i++)
        printf("%d - %d \t%d \n", parent[i], i,
            graph[i][parent[i]]);
    count++;
}
void primMST(int graph[V][V])
{
    int count=0;
    int parent[V];
    int key[V];
    bool mstSet[V];
    for (int i = 0; i < V; i++)
        key[i] = INT_MAX, mstSet[i] = false;
    count++;
    key[0] = 0;
    count++;
    parent[0] = -1;
    count++;
    for (int count = 0; count < V - 1; count++) {
        int u = minKey(key, mstSet);
        count++;
        mstSet[u] = true;
        count++;
        for (int v = 0; v < V; v++)
            if (graph[u][v] && mstSet[v] == false
                && graph[u][v] < key[v])
                parent[v] = u, key[v] = graph[u][v];
    }
    printMST(parent, graph);
    printf(" time completity is %d",count);
}
int main()
{
    int graph[V][V] = { { 0, 2, 0, 6, 0 },
        { 2, 0, 3, 8, 5 },
        { 0, 3, 0, 0, 7 },
        { 6, 8, 0, 0, 9 },
        { 0, 5, 7, 9, 0 } };
    primMST(graph);

    return 0;
}

```

Output:

```

27. Write a program to perform sorting without using swapping and estimate time complexity.

Program:

```
#include <stdio.h>

void selection_sort(int arr[], int n) {
    int i, j, min_idx;
    for (i = 0; i < n-1; i++) {
        min_idx = i;
        for (j = i+1; j < n; j++)
            if (arr[j] < arr[min_idx])
                min_idx = j;
        int temp = arr[min_idx];
        for (j = min_idx; j > i; j--)
            arr[j] = arr[j-1];
        arr[i] = temp;
    }
}

int main() {
    int arr[] = {64, 25, 12, 22, 11};
    int n = sizeof(arr)/sizeof(arr[0]);
    selection_sort(arr, n);
    printf("Sorted array: \n");
    for (int i=0; i < n; i++)
        printf("%d ", arr[i]);
    return 0;
}
```

Output:

Sorted array:

11 12 22 25 64

28 Write a program to perform Bubble sort and estimate time Complexity for n values.

Perform test cases for the following set of numbers.

A..(10,5, 80,-2,5,23, 45) B. (12, 3, 0, 34, -11, 34, 22, 8) C.(3, 35, -56, 66, 77, -78, 82)

Program:

```
#include<stdio.h>
```

```
int main(){
    int ele,count=0;

    printf("Enter total element: ");
    scanf("%d",&ele);
```

```

1 2 3 4

Time complexity: 16^n

34. Write a program to find out Hamiltonian circuit Using backtracking method.

And estimate the time complexity for the given set of elements is

	a	b	c	d	e	f
a	0	0	1	1	1	1
b	0	0	1	0	0	1
c	1	1	0	1	1	1
d	1	0	1	0	1	0
e	1	0	0	1	0	0
f	1	1	1	0	0	0

Program:

```
#include <stdio.h>
#define MAX 20

int n;
int adj[MAX][MAX];
int x[MAX];

int is_safe(int v, int pos) {
    int i;
    for (i = 0; i < n; i++)
        if (adj[v][i] && x[i] == pos)
            return 0;
    return 1;
}

int hamiltonian_cycle(int pos) {
    int v;
    if (pos == n) {
        if (adj[x[pos - 1]][x[0]])
            return 1;
        else
            return 0;
    }
    for (v = 0; v < n; v++) {
        if (is_safe(v, pos)) {
            x[pos] = v;
            if (hamiltonian_cycle(pos + 1))
                return 1;
            x[pos] = -1;
        }
    }
}
```

```

    return 0;
}

int main() {
    int i, j;
    printf("Enter number of vertices: ");
    scanf("%d", &n);
    printf("Enter adjacency matrix:\n");
    for (i = 0; i < n; i++)
        for (j = 0; j < n; j++)
            scanf("%d", &adj[i][j]);
    for (i = 0; i < n; i++)
        x[i] = -1;
    x[0] = 0;
    if (hamiltonian_cycle(1) == 0)
        printf("\nSolution does not exist\n");
    else {
        printf("\nSolution exists:\n");
        for (i = 0; i < n; i++)
            printf("%d ", x[i]);
        printf("%d", x[0]);
    }
    return 0;
}

```

Output:

Enter number of vertices: 3

Enter adjacency matrix:

0

2

3

4

0

6

9

8

0

Solution exists:

0 0 1 0

35. Write a program to return all the possible subsets for a given integer array. Return the solution in any order.

Input nums= [1,2,3]

Output : [[], [1], [2], [3], [1,2], [1,3], [2,3], [1,2,3]]

Program:

36. Write a program to compute container loader Problem for the given values and estimate time complexity.

N=8 be total no of containers having weights (w1, w2, w3,...w8) = [50, 100, 30, 80, 90, 200, 150, 20]. Capacity value = 100

Program:

```

#include <stdio.h>
#include <stdlib.h>

```

```

#define MAX_ITEMS 100
#define MAX_WEIGHT 100

int weight[MAX_ITEMS];
int value[MAX_ITEMS];
int dp[MAX_ITEMS][MAX_WEIGHT];

int max(int a, int b) {
    return (a > b) ? a : b;
}

int knapsack(int n, int w) {
    int i, j;
    for (i = 0; i <= n; i++) {
        for (j = 0; j <= w; j++) {
            if (i == 0 || j == 0) {
                dp[i][j] = 0;
            } else if (weight[i-1] <= j) {
                dp[i][j] = max(value[i-1] + dp[i-1][j-weight[i-1]], dp[i-1][j]);
            } else {
                dp[i][j] = dp[i-1][j];
            }
        }
    }
    return dp[n][w];
}

int main() {
    int n = 4;
    int w = 10;
    weight[0] = 1;
    weight[1] = 2;
    weight[2] = 3;
    weight[4] = 4;
    weight[5] = 5;
    weight[6] = 6;
    weight[7] = 7;
    weight[8] = 8;
    value[0] = 50;
    value[1] = 100;
    value[2] = 30;
    value[3] = 80;
    value[4] = 90;
    value[5] = 200;
    value[6] = 150;
    value[7] = 20;
    int result = knapsack(n, w);
    printf("Result: %d\n", result);
    return 0;
}

```

Output:

37. Write a program to find a minimum spanning tree using prims technique for the given graph.

Program:

```
#include <stdio.h>
#include <limits.h>
#define vertices 5
int minimum_key(int k[], int mst[])
{
    int minimum = INT_MAX, min,i,count=0;
    for (i = 0; i < vertices; i++)
        if (mst[i] == 0 && k[i] < minimum )
            minimum = k[i], min = i;
    return min;
    count++;
}
void prim(int g[vertices][vertices])
{
    int parent[vertices];
    int k[vertices];
    int mst[vertices];
    int i, count,edge,v;
    for (i = 0; i < vertices; i++)
    {
        k[i] = INT_MAX;
        count++;
    }
}
```

```

        mst[i] = 0;
            count++;
    }
    count++;
    k[0] = 0;
        count++;
    parent[0] = -1;
        count++;

for (count = 0; count < vertices-1; count++)
{
    edge = minimum_key(k, mst);
    mst[edge] = 1;
    for (v = 0; v < vertices; v++)
    {
        if (g[edge][v] && mst[v] == 0 && g[edge][v] < k[v])
        {
            parent[v] = edge, k[v] = g[edge][v];
        }
    }
}

    count++;
    count++;
    count++;
    printf("\n Edge \t Weight\n");
    for (i = 1; i < vertices; i++)
    printf(" %d <-> %d   %d \n", parent[i], i, g[i][parent[i]]);
    count++;
    printf(" time complexity is :%d",count);

}

int main()
{
    int g[vertices][vertices] = { {0, 0, 3, 0, 0},
                                   {0, 0, 10, 4, 0},
                                   {3, 10, 0, 2, 6},
                                   {0, 4, 2, 0, 1},
                                   {0, 0, 6, 1, 0},
                                   };

    prim(g);
    return 0;
}

```

Output:

```
C:\Users\Chint\OneDrive\Desktop\toc\DAA\prims.exe

Edge    Weight
3 <-> 1    4
0 <-> 2    3
2 <-> 3    2
3 <-> 4    1
time complexity is :8

Process exited after 0.05919 seconds with return value 0
Press any key to continue . . .
```

38. Write a program to print a minimum and maximum value sequence for all the numbers in a list.

Input a[]=(3, 5, -4, 1, 8, 2, 0, 4) Output (-4, 8, 0, 5, 1, 4, 3, 2)

39. Write a program to check sub string is there in a string or not.

Input/Output		
a. original string = "babad"	b. Original string = "babad"	c. Original string =
"babad"		
Sub string = "shahad"	Sub string = "daa"	Sub string = "aba"
Output = Found	Output = Not Found	Output = Found

Program:

```
#include<stdio.h>

int main()
{
    char str[80], search[10];
    int count1 = 0, count2 = 0, i, j, flag;

    printf("Enter a string:");
    gets(str);
    printf("Enter search substring:");
    gets(search);
    while (str[count1] != '\0')
        count1++;
    while (search[count2] != '\0')
        count2++;
    for (i = 0; i <= count1 - count2; i++)
    {
        for (j = i; j < i + count2; j++)
        {
            flag = 1;
            if (str[j] != search[j - i])
            {
```

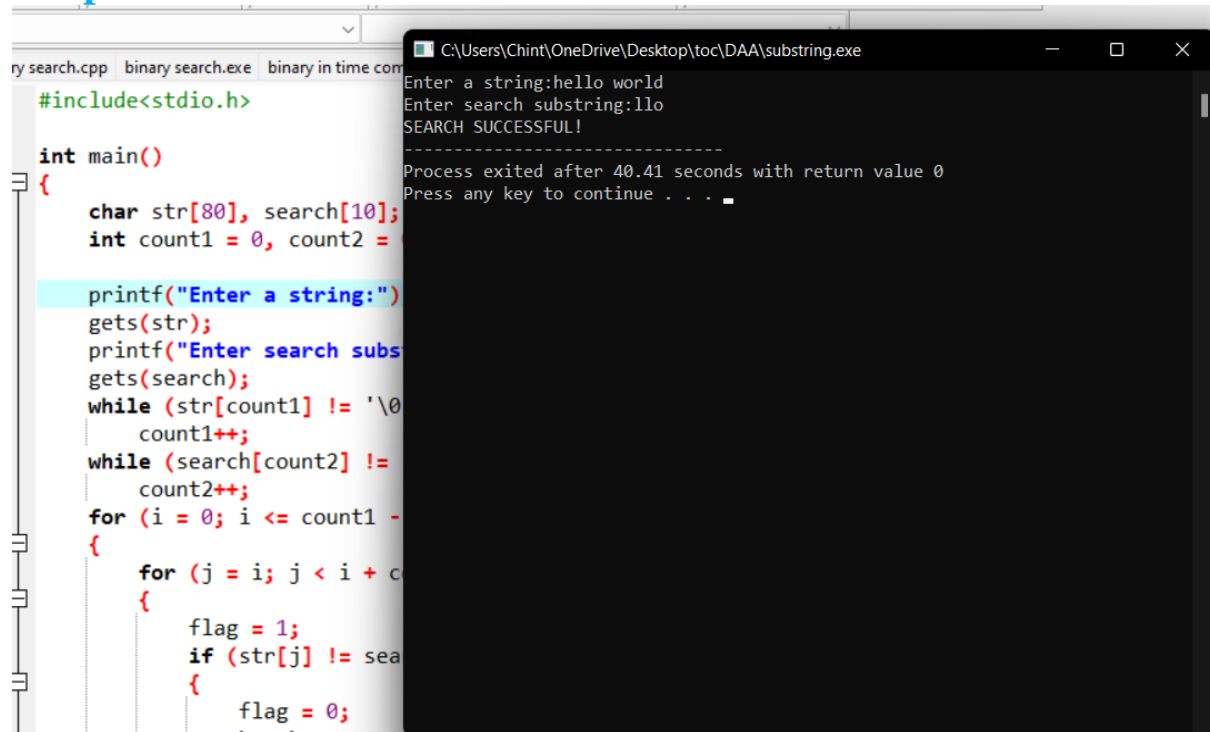

```

        flag = 0;
        break;
    }
}
if (flag == 1)
    break;
}
if (flag == 1)
    printf("SEARCH SUCCESSFUL!");
else
    printf("SEARCH UNSUCCESSFUL!");

return 0;
}

```

Output:

The image shows a code editor on the left and a terminal window on the right. The code editor displays a C program for substring search. The terminal window shows the execution of the program, where the user enters 'hello world' and 'llo', resulting in a 'SEARCH SUCCESSFUL!' message.

```

ry search.cpp  binary search.exe  binary in time com
#include<stdio.h>
